

# JavaScript Loops

- Very often when you write code, you want the same block of code to run over and over again in a row.
- Instead of adding several almost equal lines in a script we can use loops to perform a task like this.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# JavaScript Loops

- In JavaScript there are two different kind of loops:
- **for** - loops through a block of code a specified number of times.
- **while** - loops through a block of code while a specified condition is true.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# The for Loop

- The for loop is used when you know in advance how many times the script should run.

```
for (var=start;var<=end;var=var+increment)
{
    code to be executed
}
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# The for Loop

- Ex: define a loop that starts with  $i=0$ . The loop will continue to run as long as  $i$  is less than, or equal to 10.  $i$  will increase by 1 each time the loop runs.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## The for Loop

- Ex: define a loop that starts with  $i=0$ . The loop will continue to run as long as  $i$  is less than, or equal to 10.  $i$  will increase by 1 each time the loop runs.

```
<html>
<body>
<script type="text/javascript">
var i=0
for (i=0; i<=10; i++)
document.write("The number is " + i)
document.write("<br />")
</script>
</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## The while loop

- The while loop is used when you want the loop to execute and continue executing while the specified condition is true.

```
while (var<=endvalue)
{
    code to be executed
}
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## The while loop

- Ex: define a loop that starts with  $i=0$ . The loop will continue to run as long as  $i$  is less than, or equal to 10.  $i$  will increase by 1 each time the loop runs.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## The while loop

- Ex: define a loop that starts with  $i=0$ . The loop will continue to run as long as  $i$  is less than, or equal to 10.  $i$  will increase by 1 each time the loop runs.

```
<html>
<body>
<script type="text/javascript">
var i=0
while (i<=10)
{
    document.write("The number is " + i)
    document.write("<br />")
    i=i+1
}
</script>
</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## The do...while Loop

- The do...while loop is a variant of the while loop. This loop will always execute a block of code ONCE, and then it will repeat the loop as long as the specified condition is true.
- This loop will always be executed at least once, even if the condition is false, because the code is executed before the condition is tested.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## The do...while Loop

- The do...while loop is a variant of the while loop. This loop will always execute a block of code ONCE, and then it will repeat the loop as long as the specified condition is true.
- This loop will always be executed at least once, even if the condition is false, because the code is executed before the condition is tested.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## The do...while Loop

- The do...while loop is a variant of the while loop. This loop will always execute a block of code ONCE, and then it will repeat the loop as long as the specified condition is true.
- This loop will always be executed at least once, even if the condition is false, because the code is executed before the condition is tested.

```
<html>
<body>
<script type="text/javascript">
var i = 1;
do
{
document.write("The number is " + i)
document.write("<br>");
i=i+1;
}
while (i<10)
</script>
</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## JavaScript break and continue Statements

- There are two special statements that can be used inside loops: break and continue.
- **Break**
  - The break command will break the loop and continue executing the code that follows after the loop (if any).

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## JavaScript break and continue Statements

- There are two special statements that can be used inside loops: break and continue.

- **Break**

```
<html>
<body>
<script type="text/javascript">
var i=0
for (i=0;i<=10;i++)
{
  break;
  document.write("The number is " + i)
}
</script>
</body>
</html>
```

- The **break** command will break the loop and continue executing the code that follows after the loop (if any).

## JavaScript break and continue Statements

- The **continue** command will break the current loop and continue with the next value.

## JavaScript break and continue Statements

- There are two special statements that can be used inside loops: break and continue.

- **Break**

```
<html>
<body>
<script type="text/javascript">
var i=0
for (i=0;i<=10;i++)
{
  break;
  document.write("The number is " + i)
}
</script>
</body>
</html>
```

- The **break** command will break the loop and continue executing the code that follows after the loop (if any).

## JavaScript For...In Statement

- The **for...in** statement is used to loop (iterate) through the elements of an array or through the properties of an object.
- The code in the body of the **for ... in** loop is executed once for each element/property.

# JavaScript For...In Statement

- The **for...in** statement is used to loop (iterate) through the elements of an array or through the properties of an object.
- The code in the body of the **for ... in** loop is executed once for each element/property.

# Example

```
<html>
<body>
<script type="text/javascript">
var x
var mycars = new Array()
mycars[0] = "Saab"
mycars[1] = "Volvo"
mycars[2] = "BMW"

for (x in mycars)
{
document.write(mycars[x] + "<br />")
}
</script>
</body>
</html>
```

# Events

- Events are actions that can be detected by JavaScript.
- Every element on a web page has certain events which can trigger JavaScript functions.
- We can use the onClick event of a button element to indicate that a function will run when a user clicks on the button.

# Events

- We define the events in the HTML tags.
- Examples of events:
  - ✓ A mouse click
  - ✓ A web page or an image loading
  - ✓ Mousing over a hot spot on the web page
  - ✓ Selecting an input box in an HTML form
  - ✓ Submitting an HTML form
  - ✓ A keystroke

## onload and onUnload

- The onload and onUnload events are triggered when the user enters or leaves the page.
- The onload event is often used to check the visitor's browser type and browser version, and load the proper version of the web page based on the information.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## onload and onUnload

- Both the onload and onUnload events are also often used to deal with cookies that should be set when a user enters or leaves a page.
- For example, you could have a popup asking for the user's name upon his first arrival to your page.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## onload and onUnload

```
<html>
<head>
<script type="text/javascript">
var username="guest";
function load()
{
username=prompt("Enter your username", username);
document.getElementById("name").innerHTML = username;
}

function myFunction()
{
document.write("Hello");
}
</script>
</head>
<body onload="load()">
Hello, <span id="name"></span><br>
</body>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## onFocus, onBlur and onChange

- The onFocus, onBlur and onChange events are often used in combination with validation of form fields.
- Below is an example of how to use the onChange event. The checkEmail() function will be called whenever the user changes the content of the field

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## onFocus, onBlur and onChange

- The onFocus, onBlur and onChange events are often used in combination with validation of form fields.
- Below is an example of how to use the onChange event. The checkEmail() function will be called whenever the user changes the content of the field

```
<input type="text" size="30" id="email" onChange="checkEmail()" />
```

## onSubmit

- The onSubmit event is used to validate ALL form fields before submitting it.
- The checkForm() function will be called when the user clicks the submit button in the form.
- If the field values are not accepted, the submit should be cancelled.

## onSubmit

- The function checkForm() returns either true or false.
- If it returns true the form will be submitted, otherwise the submit will be cancelled.

## onSubmit

- The function checkForm() returns either true or false.
- If it returns true the form will be submitted, otherwise the submit will be cancelled.

```
<form method="post" action="xxx.php" onSubmit="return checkForm()">
```

## onmouseover and onmouseout

- onmouseover and onmouseout are often used to create "animated" buttons.
- As example of an onmouseover event. An alert box appears when an onmouseover event is detected.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## onmouseover and onmouseout

- onmouseover and onmouseout are often used to create "animated" buttons.

```
<a href="http://www.somewhere.com"
onmouseover="alert('An onmouseover event!');return
false">
<img alt="A button with an onmouseover event" />
</a>
```

- As example of an onmouseover event. An alert box appears when an onmouseover event is detected.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## JavaScript - Catching Errors

- There are two ways of catching errors in a Web page:
  - By using the try...catch statement (available in IE5+, Mozilla 1.0, and Netscape 6)
  - By using the onerror event. This is the old standard solution to catch errors (available since Netscape 3)

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Try...Catch Statement

- The try...catch statement allows you to test a block of code for errors.
- The **try** block contains the code to be run, and the **catch** block contains the code to be executed if an error occurs.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Try...Catch Statement

- The **try** statement allows you to test a block of code for errors.  
`//Run some code here`
- The **try block** contains the code to be run, and the **catch block** contains the code to be executed if an error occurs.  
`//Handle errors here`

# Example

```
<html>
<head>
<script type="text/javascript">
function message()
{
addAlert("Welcome guest!");
}
</script>
</head>

<body>
<input type="button" value="View message"
onclick="message()" />
</body>
</html>
```

# Example

```
function message()
{
  try
  {
addAlert("Welcome guest!");
  }
catch(err)
  {
    txt="There was an error on this page.\n\n"
    txt+="Error description: " + err.description
    txt+="\nClick OK to continue.\n\n"
    alert(txt)
  }
}
```

# The Throw Statement

- The throw statement allows you to create an exception.
- If you use this statement together with the **try...catch** statement, you can control program flow and generate accurate error messages.

# The Throw Statement

- The throw statement allows you to create an exception.
- If you use **this statement** together with the **try...catch** statement, you can control program flow and generate accurate error messages.

# Example

```
<html>
<body>
<script type="text/javascript">
var x=prompt("Enter a number (0..10):","")
try
{
if(x>10)
throw "Err1"
else if(x<0)
throw "Err2"
}
catch(er)
{
if(er=="Err1")
alert("Error! The value is too high")
if(er == "Err2")
alert("Error! The value is too low")
}
</script>
</body>
</html>
```

# The onerror Event

- The onerror event is fired whenever there is a script error in the page.
- To use the onerror event, you must create a function to handle the errors.
- Then you call the function with the onerror event handler.

# The onerror Event

- The event handler is called with three arguments:
  - msg (error message)
  - url (the url of the page that caused error)
  - line (the line where the error occurred)

# The onerror Event

- The event handler is called with three arguments:

```
onerror=handleErr
```

- `msg` (error message)

- `url` (the url of the page that caused error)

- `line` (the line where the error occurred)

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# The onerror Event

- The value returned by `onerror` determines whether the browser displays a standard error message.
- If you return **false**, the browser displays the standard error message in the JavaScript console.
- If you return **true**, the browser does not display the standard error message.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Example

```
<html>
<head>
<script type="text/javascript">
onerror=handleErr
var txt=""

function handleErr(msg,url,l)
{
txt="There was an error on this page.\n\n"
txt+="Error: " + msg + "\n"
txt+="URL: " + url + "\n"
txt+="Line: " + l + "\n"
txt+="Click OK to continue.\n\n"
alert(txt)
return true
}
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Example

```
function message()
{
addAlert("Welcome guest!")
}
</script>
</head>

<body>
<input type="button" value="View message"
onclick="message()" />
</body>

</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# javascript objects

costantino pistagna <pistagna@dmi.unict.it>

## A Basic Class & Instance

```
function myFunc(){  
}  
  
var myObject = new myFunc();  
alert(typeof myObject); // displays "object"
```

We've just created our own object.

(c) 2009 - costantino pistagna - pistagna@dmi.unict.it - http://aladino.dmi.unict.it - all rights reserved.

How does JavaScript know  
how to create an object?

```
function myFunc(){  
  return 5;  
}  
  
var myObject = myFunc();  
alert(typeof myObject); // displays "number"
```

(c) 2009 - costantino pistagna - pistagna@dmi.unict.it - http://aladino.dmi.unict.it - all rights reserved.

How does JavaScript know  
how to create an object?

```
function myFunc(){  
  return 5;  
}  
  
var myObject = new myFunc();  
alert(typeof myObject); // displays "number"
```

The answer is:

**NEW**

(c) 2009 - costantino pistagna - pistagna@dmi.unict.it - http://aladino.dmi.unict.it - all rights reserved.

## Public Member Variable & Functions

Public functions and variables  
Are available to access on an instance of a class.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Public Member Variable & Functions

Public functions and variables  
Are available to access on an instance of a class.

```
//public member variable  
MyClass.prototype.publicVar = "My Public Variable";  
  
//public member function  
MyClass.prototype.publicFunction = function () {  
    alert( this.publicVar );  
}
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Create an instance and run a member function

```
//public member variable  
MyClass.prototype.publicVar = "My Public Variable";  
  
//public member function  
MyClass.prototype.publicFunction = function () {  
    alert( this.publicVar );  
}  
  
//create an instance  
var oClass = new MyClass();  
  
//run a member function  
oClass.publicFunction(); //Alert: "My Public Variable"
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Private members

Private member functions and variables are hidden to outside code. Only public functions can access them.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Private members

Private member functions and variables are hidden to outside code. Only public functions can access them.

```
function MyClass () {
  //reference to this
  var self = this;
  //private member variable
  var privateVar = "My Private Variable";
  //public function
  this.publicVar = "My Public Variable";
  //private function
  var privateFunction = function () {
    self.publicVar += " Modified By A Private Fucntion";
    alert( self.publicVar );
  }
}

//create an instance
var oClass = new MyClass();
//run a private member function
oClass.privateFunction(); //private function is undefined
//get a private member var
alert( oClass.privateVar ); //private var is undefined
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Static members

A static function or variable is available on the base class but is not available to the class instance.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Static members

```
function MyClass () {
  //...
}

//declare a static member
MyClass.staticVar = "My static variable";
//declare a static function
MyClass.staticFunction = function ( pInput ) {
  return new MyClass( MyClass.staticVar , pInput );
}

//create an instance
var oClass = new MyClass();

//run a static function (NO access to private or public)
oClass.staticFunction( 9 ); //staticFunction is undefined on an instance
//run a privileged member function on the class
MyClass.privilegedFunction(); //The function runs
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Privileged members

A privileged member function:

- Has access to private variables
- Is available publicly.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Privileged members

```
function MyClass () {  
    //private member variable  
    var privateVar = "My Private Variable";  
    //privileged member function  
    this.privilegedFunction = function () {  
        alert( privateVar );  
    }  
}  
//create an instance  
var oClass = new MyClass();  
  
//run a privileged member function  
//Output: alerts the value of the private var  
oClass.privilegedFunction();
```

A privileged member function:

- Has access to private variables

- Is available publicly.

## Properties

- Properties are the values associated with an object.
- In the following example we are using the length property of the String object to return the number of characters in a string

## Properties

- Properties are the values associated with an object.
- In the following example we are using the length property of the String object to return the number of characters in a string

```
<script type="text/  
javascript">  
    document.write(txt.length);  
</script>
```

## Methods

- Methods are the actions that can be performed on objects.
- In the following example we are using the toUpperCase() method of the String object to display a text in uppercase letters:

## Methods

- Methods are the actions that can be performed on objects.

```
<script type="text/javascript">  
var str="Hello world!"  
document.write (str.toUpperCase())  
</script>
```

- In the following example we are using the toUpperCase() method of the String object to display a text in uppercase letters:

## String object

- The String object is used to manipulate a stored piece of text.

```
var txt="Hello world!"  
document.write (txt.length)
```

```
var txt="Hello world!"  
document.write (txt.toUpperCase())
```

## Defining Dates

- The Date object is used to work with dates and times.
- We define a Date object with the new keyword. The following code line defines a Date object called myDate:

```
var myDate=new Date()
```

## Manipulate Dates

- We can easily manipulate the date by using the methods available for the Date object.
- In the example below we set a Date object to a specific date (14th January 2008):

```
var myDate=new Date()  
myDate.setFullYear(2008,0,14)
```

## Manipulate Dates

- And in the following example we set a Date object to be 5 days into the future:

```
var myDate=new Date()  
myDate.setDate(myDate.getDate()+5)
```

## Comparing Dates

- The Date object is also used to compare two dates.
- The following example compares today's date with the 14th January 2010.

## Comparing Dates

- The Date object is also used to compare two dates.  

```
var myDate=new Date()  
myDate.setDate(new Date(2010,0,14).getTime())  
var today=new Date()  
if (myDate>today  
alert("Today is before 14th January 2010")  
else  
alert("Today is after 14th January 2010")
```
- The following example compares today's date with the 14th January 2010.

## Defining Arrays

- The Array object is used to store a set of values in a single variable name.
- We define an Array object with the **new** keyword.

## Defining Arrays

- The Array object is used to store a set of values in a single variable name.
- We define an Array object with the **new** keyword.

```
var myArray=new Array()
```

## Defining Arrays

- There are two ways of adding values to an array:
- you can add as many values as you need to define as many variables you require.

## Defining Arrays

- There are two ways of adding values to an array:
- you can add as many values as you need to define as many variables you require.

```
var mycars=new Array()  
mycars[0]="Saab"  
mycars[1]="Volvo"  
mycars[2]="Audi"
```

## Defining Arrays

- You could also pass an integer argument to control the array's size

## Defining Arrays

- You could also pass an integer argument to control the array's size.

```
var mycars=new Array(3);  
mycars[0]="Saab"  
mycars[1]="Volvo"  
mycars[2]="BMW"
```

## Defining Arrays

- You could also pass an integer argument to control the array's size

## Accessing Arrays

- You can refer to a particular element in an array by referring to the name of the array and the index number.
- The index number starts at 0.

## Accessing Arrays

- You can refer to a particular element in an array by referring to the name of the array and the index number.
- The index number starts at 0.

## Modify Values in Existing Arrays

- To modify a value in an existing array, just add a new value to the array with a specified index number.

## Modify Values in Existing Arrays

- To modify a value in an existing array, just add a new value to the array with a specified index number.

## Boolean Object

- The Boolean object is an object wrapper for a Boolean value.
- The Boolean object is used to convert a non-Boolean value to a Boolean value (true or false).
- We define a Boolean object with the new keyword.

## Boolean Object

- The Boolean object is an object wrapper for a Boolean value.
- The Boolean object is used to convert a non-Boolean value to a Boolean value (true or false).
- We define a Boolean object with the new keyword.

# Math Object

- The Math object allows you to perform common mathematical tasks.
- The Math object includes several mathematical values and functions.
- You do not need to define the Math object before using it.

# Math Object

- The Math object allows you to perform common mathematical tasks.
- The Math object includes several mathematical values and functions.
- You do not need to define the Math object before using it.

# Math Object

Method	Description	FF	N	IE
<a href="#">abs(x)</a>	Returns the absolute value of a number	1	2	3
<a href="#">acos(x)</a>	Returns the arccosine of a number	1	2	3
<a href="#">asin(x)</a>	Returns the arcsine of a number	1	2	3
<a href="#">atan(x)</a>	Returns the arctangent of x as a numeric value between -PI/2 and PI/2 radians	1	2	3
<a href="#">atan2(y,x)</a>	Returns the angle theta of an (x,y) point as a numeric value between -PI and PI radians	1	2	3
<a href="#">ceil(x)</a>	Returns the value of a number rounded upwards to the nearest integer	1	2	3
<a href="#">cos(x)</a>	Returns the cosine of a number	1	2	3
<a href="#">exp(x)</a>	Returns the value of E <sup>x</sup>	1	2	3
<a href="#">floor(x)</a>	Returns the value of a number rounded downwards to the nearest integer	1	2	3
<a href="#">log(x)</a>	Returns the natural logarithm (base E) of a number	1	2	3
<a href="#">max(x,y)</a>	Returns the number with the highest value of x and y	1	2	3
<a href="#">min(x,y)</a>	Returns the number with the lowest value of x and y	1	2	3
<a href="#">pow(x,y)</a>	Returns the value of x to the power of y	1	2	3
<a href="#">random()</a>	Returns a random number between 0 and 1	1	2	3
<a href="#">round(x)</a>	Rounds a number to the nearest integer	1	2	3
<a href="#">sin(x)</a>	Returns the sine of a number	1	2	3
<a href="#">sqrt(x)</a>	Returns the square root of a number	1	2	3
<a href="#">tan(x)</a>	Returns the tangent of an angle	1	2	3
<a href="#">toString()</a>	Represents the source code of an object	1	4	-
<a href="#">valueOf()</a>	Returns the primitive value of a Math object	1	2	4

# The HTML DOM

- The HTML DOM is a W3C standard and it is an abbreviation for the Document Object Model for HTML.
- The HTML DOM defines a standard set of objects for HTML, and a standard way to access and manipulate HTML documents.

# The HTML DOM

- All HTML elements, along with their containing text and attributes, can be accessed through the DOM.
- The contents can be modified or deleted, and new elements can be created.

(c) 2009 - costantino pistagna - pistagna@dmf.unict.it - http://aladino.dmf.unict.it - all rights reserved.

# The HTML DOM

- The HTML DOM is platform and language independent.
- It can be used by any programming language like Java, **JavaScript**, and VBScript.

(c) 2009 - costantino pistagna - pistagna@dmf.unict.it - http://aladino.dmf.unict.it - all rights reserved.

# Browser Detection

- there are some things that just don't work on certain browsers - specially on older browsers.
- So, sometimes it can be very useful to detect the visitor's browser type and version, and then serve up the appropriate information.

(c) 2009 - costantino pistagna - pistagna@dmf.unict.it - http://aladino.dmf.unict.it - all rights reserved.

# Browser Detection

- The best way to do this is to make your web pages smart enough to look one way to some browsers and another way to other browsers.
- JavaScript includes an object called the **Navigator** object, that can be used for this purpose.

(c) 2009 - costantino pistagna - pistagna@dmf.unict.it - http://aladino.dmf.unict.it - all rights reserved.

# Browser Detection

- The best way to do this is to make your web pages smart enough to look one way to some browsers and another way to other browsers.
- JavaScript includes an object called the **Navigator** object, that can be used for this purpose.

```
<html>
<body>
  var browser=navigator.appName
  var version=navigator.appVersion
  var version=parseFloat(version)
  document.write("Browser name: "+ browser)
  document.write("Browser version: "+ version)
</body>
</html>
```

# Browser Detection

```
<html>
<head>
<script type="text/javascript">
function detectBrowser()
{
  var browser=navigator.appName
  var b_version=navigator.appVersion
  var version=parseFloat(b_version)
  if ((browser=="MSIE" || browser=="Mozilla" || browser=="Trident" || browser=="Edge")
  && (version>=4))
  {alert("Your browser is good enough!")}
  else
  {alert("It's time to upgrade your browser!")}
}
</script>
</head>
<body onload="detectBrowser()">
</body>
</html>
```

- The best way to do this is to make your web pages smart enough to look one way to some browsers and another way to other browsers.
- JavaScript includes an object called the **Navigator** object, that can be used for this purpose.

# What is a Cookie?

- A cookie is a variable that is stored on the visitor's computer.
- Each time the same computer requests a page with a browser, it will send the cookie too.
- With JavaScript, you can both create and retrieve cookie values.

# Create and Store a Cookie

- We will create a cookie that stores the name of a visitor.
- The first time a visitor arrives to the web page, he will be asked to enter his name
- The name is then stored in a cookie.
- The next time the visitor arrives at the same page, he will get welcome message.

# Create and Store a Cookie

- We will create a cookie that stores the name of a visitor.

```
function setCookie(c_name,value,expiredays)
{
  var exdate=new Date();
  exdate.setDate(exdate.getDate()+expiredays)
  document.cookie=c_name+"="+value+(expiredays!=null ? "; expires="+exdate.toGMTString() : "");
}
```

- The first time a visitor arrives to the web page, he will be asked to enter his name
- The name is then stored in a cookie.
- The next time the visitor arrives at the same page, he will get welcome message.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Create and Store a Cookie

```
function getCookie(c_name)
{
  if (document.cookie.length>0)
  {
    c_start=document.cookie.indexOf(c_name + "=")
    if (c_start!=-1)
    {
      c_start=c_start+1;
      c_end=document.cookie.indexOf(";",c_start)
      if (c_end==-1) c_end=document.cookie.length
      return unescape(document.cookie.substring(c_start,c_end))
    }
  }
  return ""
}
```

- We will create a cookie that stores the name of a visitor.
- The first time a visitor arrives to the web page, he will be asked to enter his name
- The name is then stored in a cookie.
- The next time the visitor arrives at the same page, he will get welcome message.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Create and Store a Cookie

```
function checkCookie()
{
  username=getCookie('username')
  if (username!=null && username!="")
  {alert('Welcome ,g in '+username+'!')}
  else
  {
    username=document.getElementById("username").value
    if (username!=null && username!="")
    {
      setCookie('username',username,365)
    }
  }
}
```

- We will create a cookie that stores the name of a visitor.
- The first time a visitor arrives to the web page, he will be asked to enter his name
- The name is then stored in a cookie.
- The next time the visitor arrives at the same page, he will get welcome message.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# JavaScript Form Validation

```
function validate_required(field,alerttxt)
{
  with (field)
  {
    if (value==null||value=="")
      {alert(alerttxt);return false}
    else {return true}
  }
}
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# JavaScript Form Validation

```
function validate_form(thisform)
{
with (thisform)
{
if (validate_required(email,"Email must be filled out!")==false)
{email.focus();return false}
}
}
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# JavaScript Form Validation

```
<body>
<form action="submitpage.htm"
onsubmit="return validate_form(this)"
method="post">
Email: <input type="text" name="email" size="30">
<input type="submit" value="Submit">
</form>
</body>

</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# JavaScript Code More Readable Using with()

- Using with(), you can reduce object references and make your code more readable.
- It is possible to have nested with() statements.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# JavaScript Code More Readable Using with()

- Using with(), you can reduce object references and make your code more readable.
- It is possible to have nested with() statements.

```
function foo() {
var x=document.forms[0].elements[0].value;
var y=document.forms[0].elements[1].value;
var z=document.forms[0].elements[2].value;
with (document) {
with (forms[0].elements[2].selectedIndex) {
var z = options[selected].text
}
}
}
```

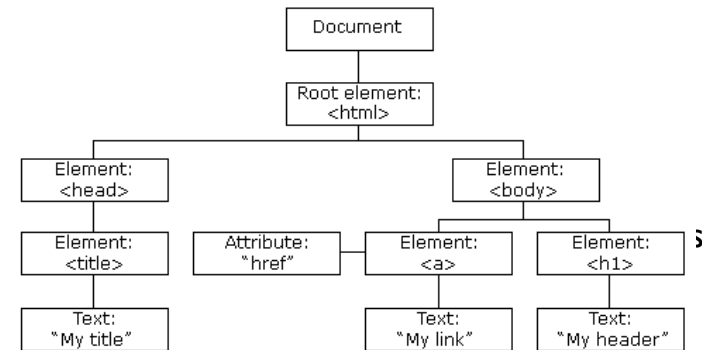

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# HTML DOM

- The HTML Document Object Model (HTML DOM) defines a standard way for accessing and manipulating HTML documents.
- The DOM presents an HTML document as a tree-structure (a node tree), with elements, attributes, and text.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# HTML DOM

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Nodes

- According to the DOM, everything in an HTML document is a node.
- The DOM says that:
  - The entire document is a document node
  - Every HTML tag is an element node
  - The texts contained in the HTML elements are text nodes
  - Every HTML attribute is an attribute node
  - Comments are comment nodes

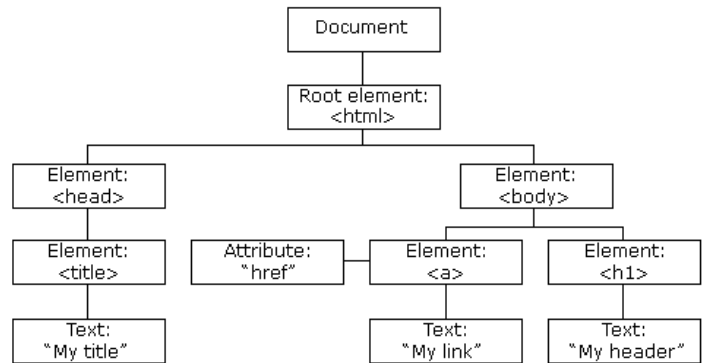

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Node Hierarchy

- Nodes have a hierarchical relationship to each other.
- All nodes in an HTML document form a document tree (or node tree).
- The tree starts at the document node and continues to branch out until it has reached all text nodes at the lowest level of the tree.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Node Hierarchy

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Node Hierarchy

- Nodes have a hierarchical relationship to each other.
  - All nodes in an HTML document form a document tree (or node tree).
  - The tree starts at the document node and continues to branch out until it has reached all text nodes at the lowest level of the tree.
- 

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Find and Access Nodes

- You can find the element you want to manipulate in several ways:
  - By using the `getElementById()` and `getElementsByTagName()` methods
  - By using the `parentNode`, `firstChild`, and `lastChild` properties of an element node

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# `getElementById()` and `getElementsByTagName()`

- The two methods `getElementById()` and `getElementsByTagName()`, can find any HTML element in the entire document.
- These methods ignore the document structure.
- If you want to find all `<p>` elements in the document, the `getElementsByTagName()` method will find them all

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## getElementById()

- The `getElementById()` method returns the element with the specified ID:

```
document.getElementById("someID");
```

## getElementsByTagName()

- The `getElementsByTagName()` can be used on any HTML element, and also on the document

```
document.getElementsByTagName("tagName");
```

## Example

- The following example returns a `nodeList` of all `<p>` elements that are descendants of the element with `id="maindiv"`:

```
document.getElementById('maindiv').getElementsByTagName("p");
```

## nodeList

- When working with a `nodeList`, we usually store the list in a variable

```
var x=document.getElementsByTagName("p");
```

## nodeList

- Now the variable x contains a list of all <p> elements in the page, and we can access the <p> elements by their index numbers.

```
var x=document.getElementsByTagName("p");
for (var i=0;i<x.length;i++)
{
  // do something with each paragraph
}
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Example

```
<html>
<body>

<form name="Form1"></form>
<form name="Form2"></form>
<form name="Form3"></form>

<script type="text/javascript">
document.write("This document contains: " + document.forms.length
+ " forms.")
</script>

</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Example

```
<html>
<body>
<form id="Form1" name="Form1">Your name: <input type="text">
</form>
<form id="Form2" name="Form2">Your car: <input type="text">
</form>
<p>To access an item in a collection you can either use the
number or the name of the item:</p>

<script type="text/javascript">
document.write("<p>The first form's name is: " +
document.forms[0].name + "</p>")
document.write("<p>The first form's name is: " +
document.getElementById("Form1").name + "</p>")
</script>

</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Example

```
<html>
<body>

<br />

<br /><br />

<script type="text/javascript">
document.write("This document contains: " +
document.images.length + " images.")
</script>

</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Example

```
<html>
<head>
<script type="text/javascript">
function changeSrc()
{
  document.getElementById("myImage").src="hackanm.gif"
}
</script>
</head>

<body>

<br /><br />
<input type="button" onclick="changeSrc()" value="Change image">
</body>

</html>
```

(c) 2009 - costantino pistagna - pistagna@dmf.unicit.it - http://aladino.dmf.unicit.it - all rights reserved.

## Example

```
<html>
<head>
<script type="text/javascript">
function changeSize()
{
  document.getElementById("compman").height="250"
  document.getElementById("compman").width="300"
}
</script>
</head>

<body>

<br /><br />
<input type="button" onclick="changeSize()" value="Change height
and width of image">
</body>

</html>
```

(c) 2009 - costantino pistagna - pistagna@dmf.unicit.it - http://aladino.dmf.unicit.it - all rights reserved.

## Example

```
<html>
<head>
<script type="text/javascript">
function whichButton(event) {
if (event.button==2) {
alert("You clicked the right mouse button!")
}
else{
alert("You clicked the left mouse button!")
}
}
</script>
</head>
<body onmousedown="whichButton(event)">
<p>Click in the document. An alert box will alert which mouse
button you clicked.</p>
</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dmf.unicit.it - http://aladino.dmf.unicit.it - all rights reserved.

## Example

```
<html>
<head>
<script type="text/javascript">
function show_coords(event) {
x=event.clientX
y=event.clientY
alert("X coords: " + x + ", Y coords: " + y)
}
</script>
</head>

<body onmousedown="show_coords(event)">
<p>Click in the document. An alert box will alert the x and y
coordinates of the mouse pointer.</p>
</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dmf.unicit.it - http://aladino.dmf.unicit.it - all rights reserved.

## Example

```
<html>
<head>
<script type="text/javascript">
function whichButton(event) {
alert(event.keyCode)
}
</script>
</head>
<body onkeyup="whichButton(event)">
<p><b>Note:</b> Make sure the right frame has focus when trying
this example!</p>
<p>Press a key on your keyboard. An alert box will alert the
unicode of the key pressed.</p>
</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Example

```
<html>
<head>
<script type="text/javascript">
function changeAction() {
var x=document.getElementById("myForm")
alert("Original action: " + x.action)
x.action="http://127.0.0.1"
alert("New action: " + x.action)
x.submit()
}
</script>
</head>
<body>
<form id="myForm" action="esempio.php">
Name: <input type="text" value="" />
<input type="button" onclick="changeAction()"
value="Change action attribute and submit form" />
</form>
</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Example

```
<html>
<head>
<script type="text/javascript">
function alertId() {
var txt="Id: " + document.getElementById("myButton").id
txt=txt + ", type: " + document.getElementById("myButton").type
txt=txt + ", value: " + document.getElementById("myButton").value
alert(txt)
document.getElementById("myButton").disabled=true
}
</script>
</head>
<body>
<form>
<input type="button" value="Click me!" id="myButton"
onclick="alertId()" />
</form>
</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Example

```
<script type="text/javascript">
function favBrowser() {
var mylist=document.getElementById("myList")
document.getElementById("favorite").value=mylist.options[mylist.s
electedIndex].text
}
</script>
<form>
Select your favorite browser:
<select id="myList" onchange="favBrowser()">
<option>Internet Explorer</option>
<option>Netscape</option>
<option>Opera</option>
</select>
<p>Your favorite browser is: <input type="text" id="favorite"
size="20"></p>
</form>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Example

```
<html>
<head>
<script type="text/javascript">
function go()
{
window.location=document.getElementById("menu").value
}
</script>
</head>

<body>
<form>
<select id="menu" onchange="go()" >
  <option>--Select a page-- </option>
  <option value="http://www.w3c.org">w3c</option>
  <option value="http://www.apple.com">Apple</option>
  <option value="http://www.gentoo.org">gentoo</option>
</select>
</form>
</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## DOM Node List

- The `getElementsByTagName()` method returns a node list.
- A node list is an array of nodes.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## DOM Node List

- The following code stores a list of `<p>` nodes (a node list) in the variable `x`:
- The `getElementsByTagName()` method returns a node list.
- A node list is an array of nodes.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## DOM Node List

- The `<p>` elements in `x` can be accessed by index number.
- To access the second `<p>` you can write:

`y=x[1];`

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Example

```
<html>
<body>

<p id="intro">DOM example</p>
<div id="main">
<p id="main1">The DOM is very useful</p>
<p id="main2">This example demonstrates how to use the
<b>getElementsByTagName and node list</b></p>
</div>
<script type="text/javascript">
x=document.getElementsByTagName("p");
document.write("Second paragraph text: " + x[1].innerHTML);
</script>

</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## DOM Node List Length

- The length property defines the length of a node list (the number of nodes).
- You can loop through a node list by using the length property:

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## DOM Node List Length

- The length property defines the length of a node list (the number of nodes).
- You can loop through a node list by using the length property:

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Navigating Node Relationships

- The three properties *parentNode*, *firstChild*, and *lastChild* follow the document structure
- They allow short-distance travel in the document.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Navigating Node Relationships

```
<html>
<body>
```

```
<p id="m1">The three properties parentNode, firstChild,  
<div id="m2"> parentNode allow the document structure  
<p id="m3"> to be navigated. firstChild returns the first child  
</div> node, and lastChild returns the last child node.  
</body>  
</html>
```

- The three properties **parentNode**, **firstChild**, and **lastChild** allow the document structure to be navigated.
- **parentNode** returns the parent node of the current node.
- **firstChild** returns the first child node of the current node.
- **lastChild** returns the last child node of the current node.

# Example

```
<html>
<body>

<p id="intro">Relationships example</p>
<div id="main">
<p id="main1">The DOM is very useful</p>
<p id="main2">This example demonstrates how to use the  
<b>firstChild</b> property</p>
</div>
<script type="text/javascript">
x=document.getElementById("intro");
document.write("The first child inside the first paragraph: " +
x.firstChild.nodeValue);
</script>

</body>
</html>
```

# Root Nodes

- There are two special document properties that allow access to the tags:

- `document.documentElement`

- `document.getElementsByTagName("body")[0]`

The first property returns the root node of the document. The second property is a special addition for HTML pages, and gives direct access to the `<body>` tag.

# Example

```
<html>
<body>

<p id="intro">Document Roots example</p>
<div id="main">
<p id="main1">The DOM is very useful</p>
<p id="main2">This example demonstrates how to use  
<b>document.body</b></p>
</div>
<script type="text/javascript">
x=document.body;
alert(x.innerHTML);
</script>

</body>
</html>
```

# Node Properties

- In the HTML Document Object Model (DOM), each node is an object.
- Objects have methods (*functions*) and properties (*information about the object*), that can be accessed and manipulated by JavaScript.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Node Properties

- The HTML Document Object Model (DOM) each node is an object.
- Objects have methods (*functions*) and properties (*information about the object*), that can be accessed and manipulated by JavaScript.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# The nodeName Property

- The nodeName property specifies the name of a node.
  - nodeName is read-only.
  - nodeName of an element node is the same as the tag name.
  - nodeName of an attribute node is the attribute name.
  - nodeName of a text node is always **#text**.
  - nodeName of the document node is always **#document**.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# The nodeValue Property

- The nodeValue property specifies the value of a node.
  - nodeValue for element nodes is undefined.
  - nodeValue for text nodes is the text itself.
  - nodeValue for attribute nodes is the attribute value.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Example: Get the Value of an Element

```
<html>
<body>

<p id="intro">Get value example</p>
<div id="main">
<p id="main1">The DOM is very useful</p>
<p id="main2">This example demonstrates how to use the
<b>nodeValue</b> property</p>
</div>
<script type="text/javascript">
x=document.getElementById("intro").firstChild;
document.write("First paragraph text: " + x.nodeValue);
</script>

</body>
</html>
```

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## The nodeType Property

- The nodeType property returns the type of node.
- nodeType is read only.
- The most important node types are:

Element type	NodeType
Element	1
Attribute	2
Text	3
Comment	8
Document	9
DOCUMENT	9
COMMENT	8

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Changing an HTML Element

- The HTML DOM and JavaScript can be used to change the inner content and attributes of HTML elements **dynamically**.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

## Changing an HTML Element

- The HTML DOM and JavaScript can be used to change the inner content and attributes of HTML elements **dynamically**.

```
<html>
<body>
<script type="text/javascript">
document.body.bgColor="yellow";
</script>
</body>
</html>
```

The following example changes the background color of the <body> element.

(c) 2009 - costantino pistagna - pistagna@dm.unict.it - http://aladino.dm.unict.it - all rights reserved.

# Changing an HTML Element

- The easiest way to get or modify the content of an element is by using the innerHTML property.

# Changing an HTML Element

- The easiest way to get or modify the content of an element is by using the innerHTML property.

```
<html>
<body>
<p id="p1">Hello World!</p>
<script type="text/javascript">
document.getElementById("p1").innerHTML="New text!";
</script>
</body>
</html>
```

The following example changes the text of the <p> element.

# Changing an HTML Element *Using Events*

- An event handler allows you to execute code when an event occurs.
- Events are generated by the browser when the user clicks an element, when the page loads, when a form is submitted, etc.

# Changing an HTML Element *Using Events*

- An event handler allows you to execute code when an event occurs.
- Events are generated by the browser when the user clicks an element, when the page loads, when a form is submitted, etc.

```
<html>
<body>
<input type="button" value="click me to change background color" />
</body>
</html>
```

The following example changes the background color of the <body> element when the button is clicked.

## Example

```
<html>
<head>
<script type="text/javascript">
function ChangeText() {
    document.getElementById("p1").innerHTML="New text!";
}
</script>
</head>
```

The following example uses a function to change the text of the `<p>` element when the button is clicked.

## Using the Style Object

- The Style object represents of each HTML element represents its individual style.
- The Style object can be accessed from the document or from the elements to which that style is applied.

## Using the Style Object

```
<html>
<head>
<script type="text/javascript">
function ChangeBackground() {
    document.body.style.backgroundColor="yellow";
}
</script>
</head>
```

- The Style object represents of each HTML element represents its individual style.
- The Style object can be accessed from the document or from the elements to which that style is applied.

The following example uses a function to change the style of the `<body>` element when the button is clicked.

## Example

```
<html>
<head>
<script type="text/javascript">
function ChangeText() {
    document.getElementById("p1").style.color="blue";
    document.getElementById("p1").style.fontFamily="Arial";
}
</script>
</head>
```

The following example uses a function to change the style of the `<p>` element when the button is clicked.
